# Focus on Women's Health

Are you taking care of your health the way you should? Whether your health is already a focus in your life or you just want to make a healthy change, the annual For Women For Life® event at Baylor Scott & White Medical Center – McKinney is made for you.

This year's free health and wellness event will include a light breakfast. The event will be held on Saturday, Jan. 28, from 8 a.m. to noon.

Highlights of this year's event will include:

- ▶ Blood pressure and cholesterol screenings
- ▶ Skin cancer screenings
- ▶ Panel discussion on disease prevention
- ▶ Health information booths

- ▶ Chair massages
- ▶ Healthy cooking demonstrations with samples
- ▶ And more!

Invite the women you care about to join you for this fun, free health and wellness event—and take the first step toward a healthier tomorrow. We hope to see you there!

## SAVE YOUR SPOT

This year's For Women For Life® event will be held at Baylor Scott & White – McKinney on Jan. 28 from 8 a.m. to noon. To register, visit [BSWHealth.com/FWFL](http://BSWHealth.com/FWFL) or call **1.800.4BAYLOR**.

## Helping Kids Cope

When a parent or grandparent is seriously ill or injured, children often have trouble understanding what is happening. They may hide their feelings to avoid upsetting the ones they love. As a result, many families are unaware of the stress these children are feeling.

That's where child life services, a new offering from Baylor Scott & White Medical Center – McKinney, can help.

"In addition to providing developmentally appropriate interventions to children who are loved by a seriously ill or injured patient, this service also helps adults understand how to emotionally support children during difficult medical situations," says Rachel Delevett, BS, a certified child life specialist on the supportive and palliative care team at Baylor Scott & White – McKinney.

The service is free and available to any Baylor Scott & White patient following a serious diagnosis. When needed, the service is also available through end-of-life care and early bereavement.

# Understand Your Thyroid Gland

Your thyroid is small, but it has a mighty job: This gland in your neck creates hormones that affect metabolism, including how quickly your heart beats and the rate at which you burn calories. But sometimes, the thyroid doesn't work as it should. Here are two conditions to watch out for.

**Hyperthyroidism** occurs when the thyroid produces too much hormone. Symptoms include unexplained weight loss; fine, soft hair that falls out frequently; warm, red skin (may be itchy); increased perspiration; feeling nervous, irritable or tired; muscle weakness; hand tremors; fast or irregular heartbeat; trouble breathing, even while resting; light or less frequent menstrual periods; and difficulty sleeping.

**Hypothyroidism** is diagnosed when the thyroid doesn't produce enough hormone. Symptoms include unexplained weight gain; coarse, thinning hair; dry, cold or yellowish skin; puffy face; brittle nails; intolerance to cold; joint or muscle pain; tiring easily or feeling weak; depression; memory problems or difficulty concentrating; and heavy or long menstrual periods.

## TALK TO A DOCTOR

If you have symptoms that concern you, an endocrinologist on the medical staff at Baylor Scott & White can help. Visit [FindDrRight.com](http://FindDrRight.com) to search for providers in North and Central Texas.

## RESOLVE TO EAT BETTER

Making a healthy change isn't easy, but it's worth it. Start by taking a closer look at what's on your plate.

**1. Dedicate half your plate to fruits and vegetables.** By eating plenty of these low-calorie foods at every meal, you'll fill up while loading up on vitamins, minerals and fiber.

**2. Go for whole grains.** Swap out refined carbohydrates (white bread, rice, tortillas, bagels) for 100 percent whole-grain foods and you'll increase your intake of dietary fiber, which can reduce your risk of heart disease, stroke and type 2 diabetes.

**3. Get on the clean-eating bandwagon.** Choose natural, fresh, minimally processed foods over more processed ones (especially packaged snacks and frozen, microwavable meals) whenever possible. You'll reduce added sugar, sodium, and saturated and trans fats in your diet, as well as artificial colors, flavors and preservatives.

## Make Over Your Menu

Could your recipe routine use a healthy revision? Go to [BSWHealth.com/Recipe](http://BSWHealth.com/Recipe) to find lots of nutritious, delicious options to try.

**17K** An estimated 17,000 spinal cord injuries happen each year in the U.S. The most common causes are motor vehicle crashes, falls, acts of violence (such as gunshots), and sports and recreational activities. **Practice prevention behind the wheel by driving carefully** and without distractions, always wearing your seat belt—and insisting passengers do the same—and ensuring young children are restrained in appropriate safety seats and boosters.

When people ask if they can help with caregiving, give them a task.

# Sweet Sacrifice

**Caring for a family member with dementia can be both exhausting and rewarding**

➔ No one but a caregiver will ever fully understand what it's like caring for a loved one with dementia.

"Caregiving is an individual experience and is as unique as every family," says Alan Stevens, PhD, director of the Center for Applied Health Research. "Many caregivers find value in caring for a family member. It brings meaning to their lives and can be viewed as a way of returning love and respect to someone. On the other end of the spectrum, caregiving is associated with emotional loss and feelings of burden and depression from daily tasks. Caregiving can also be so time-consuming that family caregivers neglect their own health."

The disadvantages of caregiving seem to be closely tied to the amount and complexity of care being provided. "Family caregivers who provide help with everyday tasks, such as bathing and dressing, and provide 24-hour supervision because it is not safe for

the loved one to be alone typically suffer the most negative consequences," Dr. Stevens says.

Fortunately, the burden of family caregiving can be lightened. Here are four tips.

**1. Know when to say no—and yes.** Caregivers are pulled in many directions. Start saying no to commitments you don't need or want to keep. And say yes when people ask if they can help. Make a list of tasks that can be handed off, and when someone offers to help, you'll know what to tell them.

**2. Read up.** Dementia is unlike any physical illness. Familiarize yourself with the type of dementia your loved one has, along with related behaviors, such as wandering, agitation and paranoia.

**3. Join a support group.** Caregivers often forgo social interests in favor of their loved one's needs. But having an outlet for dealing with stress is crucial. "I always recommend attending a support group specially

designed for caregivers," Dr. Stevens says. "Having peers to talk to and understand their situation is incredibly valuable."

**4. Get professional help.** Some situations warrant more than peer support. "Those involved with intense caregiving," Dr. Stevens says, "should seek out programs that include one-on-one sessions to provide emotional support and teach practical skills for dealing with unique behaviors that can result from dementia."

## KEEP OUR CARE IN MIND

From stroke to degenerative conditions like Parkinson's and Alzheimer's disease, Baylor Scott & White – McKinney has quality care on the brain. For more information on neuroscience services at Baylor Scott & White – McKinney, call **1.800.4BAYLOR**.

# Your Body Under Stress

## How change and other challenges can take a physical toll

➔ Stress affects our mental health, making us anxious, irritable and irrational. Left unchecked, it comes with physical consequences, too. “Stress isn’t just a mental thing. It’s very much a physiological response,” says Terry Rascoe, MD, a family medicine physician at Scott & White Clinic – Temple Northside. “In the short term, stress makes the heart rate go up, eyes dilate and blood pressure rise to enhance performance. But those kinds of responses over time wear out your organ systems.” Here is an overview.

Exercise makes you feel good.

### Cardiovascular system:

People who have high-stress jobs and those who feel isolated or lonely are at increased risk of cardiovascular disease. Even short-term stress can be enough to trigger a heart attack in someone who has atherosclerosis (narrowed arteries due to plaque buildup).

**Brain:** Stress can lead to depression, a serious mood disorder that affects sleep, weight and quality of life and increases risk of suicide.

**Reproductive system:** In women, high stress can cause irregular menstrual cycles and decreased sexual desire. In men, it can lead to decreased testosterone, low sperm count and erectile dysfunction.

**Digestive system:** Prolonged stress can lead to the development of gastrointestinal conditions such as irritable bowel syndrome, inflammatory bowel disease, gastroesophageal reflux disease and peptic ulcers.

**Weight:** Brief periods of stress can suppress the appetite, but persistent stress has the opposite outcome. During prolonged stress, the body releases the hormone cortisol, which not only stimulates appetite but also makes you reach for high-fat and high-sugar foods.

## 5 WAYS TO RELAX

1. Inhale for a count of four, hold for four, exhale for four, hold for four. Repeat.
2. Meditate.
3. Contract and release each muscle group in your body starting with your feet.
4. Exercise.
5. Practice positive self-talk.

“When I’m ready for my heart transplant, I’ll come back to Baylor Scott & White.”

—Orlandus Noel

Orlandus Noel with his father, Vincent

# Whole Hearted

**Innovative treatments offer hope for people with cardiac conditions**

→ ORLANDUS NOEL HAD a few nights of poor sleep. Then, one evening after work, he couldn’t breathe. “I felt pressure in my chest—like somebody was sitting on it,” he says. His father drove him to the doctor, where he learned he had an enlarged heart with severely diminished function. He was 24.

Noel was referred to a cardiologist, who diagnosed congestive heart failure.

“Once you have chronic heart failure, you are stabilized for as long as possible,” explains Shelley Hall, MD, chief of transplant cardiology and mechanical circulatory support/heart failure at Baylor University Medical Center at Dallas.

Noel was prescribed medications and given a LifeVest® to wear to monitor his heart and jump-start it as necessary to restore a normal rhythm. But he periodically went to the emergency department because he couldn’t breathe.

At one visit in January 2015, a doctor told the family that Noel needed the experts at Baylor Scott & White Health. Right away, Noel was taken to Baylor University Medical Center—a three-hour ride from his hometown in Oklahoma—by ambulance, with his parents following in their car.

## PREPARING FOR HEALING

At Baylor Jack and Jane Hamilton Heart and Vascular Hospital, Noel underwent more tests.

“I learned a lot,” he says. “They told me I had a leaky heart valve. And it was leaking so much that fluid was getting into my lungs.”

After several more visits to Dallas, he returned in July—this time to Baylor Annette C. and Harold C. Simmons Transplant Institute—to be evaluated by the transplant review board. They discovered that Noel had a blood infection. He wasn’t eligible for a new heart until the infection cleared.

For two months, Noel stayed in the hospital. A percutaneous ventricular assist device, or PVAD, was inserted to pump his blood for his heart.

Percutaneous assist devices—including Impella® and TandemHeart® as well as extracorporeal membrane oxygenation (ECMO) systems—are inserted through the skin and therefore don’t require major surgery. But they are short-term solutions.

“These percutaneous devices have their own pluses and minuses,” Dr. Hall notes. “Picking the right one is about analyzing the situation and choosing the device that best matches a patient’s needs.”

The goal of these PVADs is to help the body heal after shock or a cardiac event, bridging patients directly to a transplant or to a left ventricular assist device (LVAD), a mechanical pump implanted inside the chest to help the heart pump blood.

## CHOOSING HIS BEST TREATMENT

Once Noel’s infection cleared, he had the option of waiting for a new heart or having an LVAD implanted. Noel,

his family and his doctors agreed that the LVAD was best for him.

“If I get a new heart now, that heart will only last 10 or 15 years,” Noel says. “And there would be a very low percentage of me getting another heart after that. I’m now on the inactive heart transplant list.”

The plan is for him to keep the LVAD until he’s 34 or for as long as the LVAD helps him without complications.

LVADs have been revolutionary, Dr. Hall says, allowing people with heart failure to wait longer for transplants. Therefore, a lot of people choose an LVAD as a bridge, as Noel has.

Because of Baylor Scott & White’s proactive approach to selecting organ donors for heart patients, “we have one of the shortest wait times in the country,” Dr. Hall says. “As a result, we have a realistic hope we can get patients to transplant from a device.”

## GOING HOME

Regardless of the path to treatment, it’s crucial for people with chronic heart failure to work with their doctors to recognize when the condition advances.

“If you do get into a critical situation, there are devices that can potentially stabilize you and reverse the situation,” Dr. Hall says. “Ideally, the LVAD would be an elective procedure done at the right time [before an emergency] as a bridge to transplant.”

Noel was discharged three weeks after his LVAD was implanted, on Sept. 23, 2015. He participated in cardiac rehabilitation at Baylor Scott & White to regain strength and function and learn the limits of his LVAD. And by early November of that year, he was able to go home.

These days, he and his parents drive to Dallas every three months for his checkups at Baylor Scott & White. He takes regular walks and works when he can.

“Ever since they put the LVAD in,” Noel says, “I’ve been doing really well.”

## LIVE WELL WITH HEART FAILURE

Nearly 6 million American adults are living with heart failure. Fortunately, most will live full, enjoyable lives, thanks to quality medical care, education and a healthy lifestyle. We asked Gaynel Richie, MS, RN, FNP-C, a nurse practitioner with Baylor Scott & White – McKinney, to share four things individuals with heart failure can do to live well with their condition.

**1. Eat a healthy, low-sodium diet.** By limiting sodium intake to no more than 2,000 milligrams per day and fluid intake to 2 quarts per day, you can reduce excess fluid in your body and make it easier for your heart to pump, Richie says.

**2. Exercise as tolerated.** “While some individuals find it difficult to exercise without discomfort, walking is often well tolerated and offers many health benefits,” Richie says.

**3. Watch for flare-ups.** Tell your doctor if you notice any swelling, gain 3 or more pounds in a day or experience shortness of breath, chest pain, coughing, wheezing or increasing fatigue. “These could be signs that you may need urgent medical help,” Richie says.

**4. Follow doctor’s orders.** “Your physician is your biggest ally in preventing complications and reducing hospitalizations,” Richie says. “Adhere to their recommendations, get regular checkups and take your prescriptions as directed.”

## Your Heart in Good Hands

If you’ve recently been discharged from the hospital for a heart-related issue and either don’t have a primary care physician or are unable to see one for follow-up care, the Transitional Care Clinic at Baylor Scott & White – McKinney offers appointments to evaluate your progress as you transition back home and to help prevent you from being readmitted to the hospital. To learn more, call **469.764.CARE (2273)** today.

# Fighting the Top 5 Cancers

**Protect yourself with the latest  
information in oncology**

UNTIL THE DAY SCIENTISTS DEVELOP A CURE for cancer, it's up to you and your medical team to protect you from the disease. Here is the No. 1 piece of advice for preventing the five most common cancers—and what researchers are doing to improve detection and treatment.

## 1 BREAST CANCER

**Prevalence:** Nearly a quarter of a million new cases of breast cancer are diagnosed in the U.S. each year, making it the most common type of cancer in women.

**Primary protection:** For women age 40 and older, the most important measure for early detection is annual screening mammograms. Additionally, all women, including those younger than 40, are advised to do monthly breast self-exams to monitor any concerning changes in the breast.

**Promising research:** New advances in 3-D imaging technology have led to a 41 percent increase in detecting breast abnormalities compared with 2-D imaging. Also, doctors are studying the genetic makeup of breast cancer to develop better drugs. “If we know the specific genes that are driving a cancer and how those genes differ from the ones in normal cells, then we can look for drugs that can target those genes more specifically while having fewer side effects on the normal cells,” says Mark Holguin, MD, chief of oncology of Baylor Scott & White Health – Central Texas.

## 2 PROSTATE CANCER

**Prevalence:** About 1 in 7 men will be diagnosed with prostate cancer in his lifetime.

**Primary protection:** Several studies have suggested that diets high in certain vegetables (tomatoes, broccoli, and beans and other legumes) and fish may be linked with a lower risk of prostate cancer. Also, some research shows a higher risk of prostate cancer in men whose diets are high in calcium, so one way to lower risk would be to reduce dairy intake.

**Promising research:** For men who develop prostate cancer, “one type of radiation treatment is proton therapy,” Dr. Holguin says. “This treatment delivers the radiation very specifically to the cancer and may decrease the toxicity to the surrounding tissue.”

## 3 LUNG CANCER

**Prevalence:** About 1 in 4 cancer deaths is attributed to lung cancer, making it the deadliest kind in both men and women.

**Primary protection:** Don’t smoke. “The vast majority of lung cancer is clearly a result of smoking and other exposures [to tobacco smoke], but predominantly smoking,” Dr. Holguin says.

**Promising research:** People who are at high risk for lung cancer can be screened and diagnosed before symptoms develop through use of a low-dose computerized tomography (CT) scan. A study conducted by the National Cancer Institute showed that screening people at high risk of lung cancer with low-dose CT scans reduced mortality from lung cancer by 20 percent, contributing to more than 70,000 lives saved each year.

## 4 SKIN CANCER

**Prevalence:** Skin cancer is the most commonly diagnosed cancer in both men and women.

**Primary protection:** Minimize exposure to the sun. Wear sunscreen and clothing that provides adequate coverage.

**Promising research:** “A new class of drugs is adding significant survival benefits in patients with advanced melanoma,” Dr. Holguin says. “These checkpoint inhibitors help ‘unmask’ the cancer so that the immune system can recognize it and fight it off.”

## 5 COLORECTAL CANCER

**Prevalence:** Although colorectal cancer is still one of the most common cancers, the rate of new cases has decreased steadily over the last 10 years.

**Primary protection:** Get a colonoscopy. This screening not only helps detect cancer, but it’s also used by doctors to remove precancerous polyps, effectively preventing the disease from developing. Start colonoscopies at age 50 and then get one every 10 years thereafter.

**Promising research:** “Treatment has improved through the addition of targeted therapy to standard chemotherapy approaches,” Dr. Holguin says. “Also important has been the recognition of several genetically related colon cancer families, the early identification of individuals at risk and careful following of those patients.” If colorectal cancer runs in your family, consider genetic testing.

## LIFE AFTER CANCER TREATMENT

There are more than 15.5 million cancer survivors currently living in the U.S. And while surviving cancer is a tremendous victory, life after treatment comes with its own challenges. Here, Audrey Thompson, RN, OCN, an oncology nurse navigator at Baylor Scott & White Medical Center – McKinney, shares three ways to successfully transition into survivorship.

**Seek support.** “During treatment, people often have a network of support which may dissolve when treatment is over,” Thompson says. “Continuing to attend your current cancer support group or joining a survivorship group can help fill that gap.”

**Establish a new normal.** “Things will be different than they were during treatment and even before your treatment began,” Thompson says. “You may not have the energy to return to work right away and your relationships may have changed—and that’s OK. Give yourself time to adjust and find new ways to experience joy in your life.”

**Make your health a priority.** “You may still be experiencing fatigue, pain, swelling or other symptoms even after treatment ends,” Thompson says. “Be sure to take good care of yourself by feeding your mind, body and soul and seeing your doctor on a regular basis.”

# Wanted: Advance Warning

**A collaborative research project seeks to identify biomarkers that would help detect pancreatic cancer early**

➔ There are no early warning signs. No red flags. No screening tools. That's what makes pancreatic cancer so devastating.

"Most people who are diagnosed with pancreas cancer don't have symptoms until it's advanced and has already spread," explains Scott Celinski, MD, medical director of the Pancreatic Cancer Research and Treatment Center at Baylor University Medical Center at Dallas.

As the disease spreads, it becomes more difficult to treat. "People with pancreatic cancer have less than a 6 percent survival rate within five years," says Ajay Goel, PhD,

director of the Center for Epigenetics, Cancer Prevention and Cancer Genomics at Baylor Scott & White Research Institute.

Dr. Goel is leading a research project to help detect pancreatic cancer early.

The project, a collaboration between Baylor Scott & White Health and the Translational Genomics Research Institute (TGen), is focused

on uncovering biomarkers—measurable indicators of disease—that suggest pancreatic cancer.

## IDENTIFYING CANCER RISK

When a person has a precancerous pancreatic lesion, it can be surgically removed. But, Dr. Goel says, only a very small number of people with lesions are at high risk for developing cancer, so it doesn't make sense to surgically resect all lesions.

"Right now, we have no way to know who is at high risk, and existing biomarkers often are unreliable," Dr. Goel says. "We want to be able to say that we are certain if these lesions are not removed, they will develop into cancer."

With the work of Dr. Celinski and Carlos Becerra, MD, medical director of the Center for Innovative Clinical Trials at Baylor Charles A. Sammons Cancer Center, Baylor Scott & White is collecting blood and tissue samples from pancreatic cancer patients. Those samples will then be analyzed

by scientists at TGen (looking at changes in the DNA) and Dr. Goel's lab at Baylor Scott & White Research Institute (looking at RNA) to identify biomarkers in people who have cancer.

## A POSITIVE PROGNOSIS

The goal of this work is to develop a noninvasive blood test to reveal early signs of pancreatic cancer in people who are at high risk but not necessarily symptomatic.

The project is funded for three years, and, Dr. Goel says, "at the end, I'm confident we'll have a significant panel of biomarkers that we feel good about."

## ABOUT THE STUDY

### Integrated Genomic Biomarkers for the Early Detection of Pancreatic Cancer

A pilot study will generate preliminary data to identify indicators of pancreatic cancer for early detection of the disease.
